

Phishing Awareness Training

Your Guide to Staying Safe Online

Presented by: Reza Ali Sheriff

Let's Talk About Phishing!

Ever received a suspicious email or message that just felt... off? That's often phishing!

It's when tricky folks try to fool you into giving up private info like passwords or bank details.

They pretend to be someone you trust, like your bank, a colleague, or even a popular online service.

How They Try to Trick Us

The Urgency Trap

They'll make you feel like you need to act NOW to avoid a penalty or account closure.

Playing on Authority

Sometimes they'll pretend to be a boss or IT support, hoping you won't question them.

The Fear Factor

They might threaten consequences, like losing your files, to scare you into clicking.

Spotting a Phishy Email

Generic Greetings

Says "Dear Customer" instead of your name?

Weird Sender Addresses

Sender address doesn't match the company.

Grammar & Spelling Mistakes

Too many typos or odd phrasing.

Is That Website Real?

URL Check

Look closely at the address. Is it amazon.com or amaz0n.com? Tiny changes can mean big trouble.

Asking for Too Much?

If a site asks for info it shouldn't need (like a password just to view an article), it's time to close the tab!

No Lock Icon?

Always look for the padlock and <https://>. If it's missing, be extra careful with your information.

Common Phishing Stories

"Your Account is Locked!"

They want you to panic and log into their fake site immediately to "fix" the issue.

Unexpected Invoices

Did you get a bill for something you didn't buy? They hope you'll click to dispute it.

"Virus Detected!"

Fake tech support warnings designed to get you to download malware or give remote access.

Your Best Defenses: Simple Habits

Pause Before You Click

Always take a moment. Hover your mouse over links to see where they **really** go before clicking.

Use Multi-Factor Authentication (MFA)

It's like a second lock on your digital doors. Even if they get your password, they can't get in.

Go Direct

If unsure, don't click links. Go directly to the official website or call a number you know is real.

Quick Quiz: Can You Spot the Phish?

 1. "IT Support" asks for your password to fix an urgent issue. Phish or not?

✓ *Phish! Real IT teams never ask for your password.*

 2. You get a text saying you won a prize, with a link to claim it. Safe to click?

✓ *Probably a Phish! Unsolicited prize links are usually scams.*

 3. Your bank emails about a suspicious transaction with a login link. Your move?

✓ *Don't click! Open your bank's official site or app to check safely.*

Oops! I Clicked Something. Now What?

Act Fast!

If you entered credentials, change your password immediately on the **real** site.

Tell Someone

Inform your IT department or a trusted security contact right away. They are there to help!

Monitor

Keep an eye on your bank statements and online accounts for any unusual activity.

Don't panic—everyone makes mistakes. The key is taking quick action!

Wrapping Up: Key Takeaways

Awareness is Your Superpower: Phishing is all about tricking you. Being aware of their sneaky tactics is your strongest defense.

Trust Your Gut: Always be a little skeptical of urgent or unexpected messages. If it feels "off," it probably is.

Simple Habits Save the Day: Check links, use MFA, and always verify directly with the source when in doubt.

Stay Smart, Stay Safe!
